

Aaron Li, Zhixuan

zli162975@gmail.com | +852 5971 3760 | Cantonese & English speaker | Eligible to work in Hong Kong

Education Experiences

The Chinese University of Hong Kong	Master of Science in Advanced Statistics and Data Science	Aug. 2026 – May 2027
The Chinese University of Hong Kong	Bachelor of Science in Mathematics (<i>First-Class Honours</i>)	Sept. 2022 – July 2026
• Key coursework: Python and Application (A), Probability and Statistics (A), Econometrics (A), Stochastic Process (A), Optimization (A–) • Overseas Exchange: University of California, Berkeley (USA) McMaster University (Canada)		

Professional Experiences

IBM Consulting	Technical Digital Transformation Intern, GCG	July 2026 – Oct. 2026
• Developed a modelling methodology report for business analytics, covering statistical analysis, forecasting, model interpretation and risk management. Used model comparisons and simulated examples involving customer segmentation, margin analysis and credit risk to explain model principles, applicability and results in business terms, supporting the team’s model selection and communication. • Designed a business analytics framework spanning sales, procurement, production, inventory, logistics, quality inspection and finance, using XMind to map analytical dimensions, metric hierarchies and business logic. Independently developed an AI analytics platform connecting ERP data to a natural-language query interface, enabling business users to conduct quantitative analysis directly. Built an automated reporting module that plans chapters, calculates metrics, writes analytical commentary and produces complete, formatted reports covering contract execution, pipeline conversion, revenue concentration and trends in a single run. • Independently developed an issue monitoring and closure framework for a digital transformation programme spanning ERP and business systems, analysing closure throughput, dwell time and backlog trends. Introduced a “silence rate” metric, identifying that 73.8 percent of 84 open issues had no updates for at least three consecutive reporting periods, while mean recorded dwell time was approximately 37 percent of mean actual issue age. Recommended status verification, ownership clarification and follow-up mechanisms to strengthen issue closure.		
Ries Consulting	Strategy Consulting Intern	Apr. 2026 – July 2026
• Managed two client engagements concurrently, contributing to daily team meetings, expert interviews, and on-site consumer research while independently maintaining structured deliverables across both workstreams — competitive analysis, pain-point summaries, category maps, and positioning rationales — demonstrating sustained output quality under parallel deadlines. • Delivered market insights that directly shaped team strategy: competitive analysis surfaced category dynamics that reframed the team’s market understanding, and research into Japan’s elderly consumer market provided evidence that led the team to deprioritize the China mainland elderly segment — demonstrating the ability to translate primary research into decisions with real strategic consequences.		
Shenzhen Bao’an International Airport	Terminal Area Management Department, Shenzhen	Jan. 2026 – Mar. 2026
• Analyzed terminal operational data — passenger flow, gate utilization, and check-in counter allocation — to support resource-arrangement decisions across airlines and terminals, improving alignment between demand patterns and terminal capacity. • Conducted data cleaning, integration, and exploratory analysis in Python to identify congestion patterns and peak-hour pressure points affecting airline operations and passenger service efficiency. • Communicated findings through data visualizations and structured summary reports; supported evaluation of gate, counter, and staffing allocation efficiency based on historical and real-time data.		
Hong Kong Applied Science and Technology Research Institute (ASTRI)	AI and Data Intern, HK	June 2025 – Aug. 2025
• Developed a Python-based optical path tracing simulation for metalens (meta-lens) research and development, modelling how light propagates through complex optical systems and validating simulation outputs against physical principles to support experimental design. • Led end-to-end development of a Conditional Variational Autoencoder (CVAE) deep learning framework for phase retrieval: the model takes an intensity image as input and directly predicts the corresponding phase map, replacing the prior workflow in which phase data had to be computed algorithmically before model training could begin — eliminating the manual data-generation bottleneck, shortening the training pipeline, and improving reconstruction quality and model robustness.		

Projects Experiences

AI-Assisted International Airport Operations Prototype	Independent Vibe-coding Project	Mar. 2026 – Jun. 2026
• Built a functional prototype covering flight-status display, terminal navigation, passenger-flow touchpoints, and disruption communication across airports; designed product flows around real aviation use cases including transfers, departure/arrival and service-facility search — exploring how airline and airport IT systems can better support operation, with motivation for aviation-focused digital transformation.		
Ebola Virus Transmission Modelling	McMaster University, Ontario, Canada	Sep. 2024 – Dec. 2024
• Collaborated with a cross-cultural research team to build regression-based transmission models with 4–6 variables, applying Jacobian matrix analysis for equilibrium stability and conducting R simulations to develop policy recommendations for virus mitigation.		

Skills & Languages

Languages: Cantonese (native), English (fluent), Mandarin (native), Korean (fluent) — with overseas study and cross-cultural living experience across Hong Kong, mainland China, the USA, and Canada.		
Technical: Python (data analysis, simulation, deep learning), R, MATLAB, STATA; LLM API integration (Claude API, SSE streaming, sandboxed code execution); AI-assisted analytical workflow development; data visualisation (matplotlib); $\LaTeX$.		
Business & Domain: Digital transformation platform analysis; ERP and business-system data; consumer research and market analysis; terminal and aviation operational data; structured reporting and client-ready presentation; cross-functional and cross-cultural communication.		
Productivity: Proficient in Microsoft Office with experiences in producing bilingual reports and presentations in English and Chinese.
